

NOT GETTING ENOUGH TIME TO RECHARGE LEAD ACID BATTERIES

Eskom has been running continuous stage 3, 4, 5 & 6 load shedding schedules countrywide. If you are experiencing reduced runtime, please note: all AGM, Gel & Calcium Lead Acid batteries require 10-12 hours to recharge to 90%, they may require a further 4-8 hours to reach 100% state of charge (SOC).

Charging time available per load shedding stage

Stage	Recharge time available
Stage 3	5 hours 30 minutes
Stage 4	5 hours 30 minutes
Stage 5	5 hours 30 minutes
Stage 6	4 hours 30 minutes

Recharging your batteries

If your battery is not charged correctly this will lead to reduced runtime & will damage the battery.

To get the most out of your batteries, try & reduce your load & reduce the amount of discharge on your battery.

Alternatively you can contact us for a lithium battery solution which requires anywhere from 1 - 4 hours to recharge. If you have any queries please don't hesitate to contact us.
